

PREMIUMCUT

* The photo shows the execution of the PREMIUMCUT with winding and winding-up cradle)

The new PREMIUMCUT is our solution for cutting single plies from a roll - with conveyor

PREMIUMCUT is the ideal machine, if quick delivery and a large variety of different styles do not allow stack cutting.

It is the solution for single orders and MTM in the garment and upholstery industry as well as for cutting of technical textiles up to a working width of 3,4 m

A large number of combination possibilities as the concatenation with automatic winding and rewinding devices, loading devices, fabric roll storage systems with manual and automatic fabric roll changing, distinguish the PREMIUMCUT as global solution for single ply cutting, "operated by only one person".

Options:

- Automatic winding and rewinding device with driven fabric bar
- Automatic winding and rewinding device with cradle
- Loading device for fabric rolls with bar
- Loading device for fabric rolls with roll under-grasp (loading shovel)
- Two storey table for fabric rolls to be stored before and after cutting
- Transroll - the flexible storage magazine for the fabric rolls with quick change system and barcode input
- Cradle and feeding device with calander rollers to cut alternately fabric and lining automatically

To meet an automatic roll-change, the automatic detach of the fabric beginning with different fabrics and roll-diameters is absolutely necessary. Refined additional devices take care of this functionality.
